Overview

Lung cancer is the growth of abnormal cells in one or both lungs. These cells can multiply rapidly and turn into tumors that interfere with the function of the lungs and, eventually, spread to other parts of the body. Lung cancer is the second most common kind of cancer diagnosed in the United States, and accounts for nearly a third of all cancer deaths. Most people who get lung cancer were cigarette smokers, but non-smokers get it too. Exposure to radon, asbestos, and secondhand smoke are also risk factors. In some cases, there is no known cause. One of the challenging aspects of lung cancer is that it may be years before symptoms emerge. By the time it's diagnosed, about half the patients have cancer that's already spread outside the lungs. UCSF Resources

UCSF Thoracic Surgery and Oncology Clinic

The UCSF Thoracic Surgery and Oncology Clinic offers state-of-the-art diagnosis and treatment for lung cancer and other conditions related to the lungs, chest and esophagus. Our team of surgeons, medical oncologists and radiation oncologists works together closely to ensure that each patient receives comprehensive care. Our surgeons are highly skilled in minimally invasive techniques, including robot-assisted surgery, performed at UCSF since 2016. After surgery, patients receive care in our Thoracic Enhanced Recovery After Surgery Program. Bringing together a team of experts from different disciplines, this program follows a protocol before, during and after chest surgery that has been shown to decrease complications and improve results.
