Overview

Melanoma is cancer that arises from the pigment-producing cells in the uppermost layer of the skin. These cells are called melanocytes. Melanoma that originates in the skin is called cutaneous melanoma. It also may occur in the eye, a condition called ocular melanoma or intraocular melanoma. In rare cases, melanoma may begin in the digestive tract called meninges, lymph nodes or other parts of the body where there are melanocytes. Ultraviolet radiation, which is present in sunlight and in tanning beds, probably sets off many cases of melanoma by causing genetic damage in melanocytes. Children and adolescents are especially sensitive to the effects of ultraviolet light. The goal is to recognize melanoma early. Often, the first signs of melanoma are changes in a mole or the appearance of a new colored spot on the skin. When melanoma spreads, cancer cells are found in the lymphatic system. If the disease spreads to other parts of the body, it's called metastatic melanoma. The chance of developing melanoma increases with age, but it affects people of all ages and is one of the most common cancers in young adults. Website:

UCSF Resources

UCSF Melanoma & Skin Cancer Center

The UCSF Melanoma and Skin Cancer Program provides specialized care for patients with all stages of melanoma, from early-stage growths to advanced metastatic cancer, as well as for patients who are healthy but at higher risk of the disease due to family history, genetic mutations or having many abnormal moles. We also care for patients with other types of skin cancer, including squamous cell, basal cell and Merkel cell carcinomas.

Our program is part of the UCSF Helen Diller Family Comprehensive Cancer Center, designated a comprehensive cancer center by the National Cancer Institute. This designation recognizes centers that provide full-spectrum, state-of-the-art cancer care. Website: <https://sarcoma.ucsf.edu/ucsf-sarcoma-center> | Phone Number: 415-885-3800
