Overview

When detected early, testicular cancer is highly treatable and usually curable, which is why early diagnosis and treatment are so important for men of all ages. Adolescent boys and young men should be particularly aware of the signs and symptoms of the disease and perform regular testicular self-exams. Testicular cancer is a disease in which cells become malignant, meaning cancerous, in one or both of the testicles. Testicular cancer can be broadly classified into two types: seminoma and nonseminoma. A testicular cancer may have a combination of both types. Website:

UCSF Resources

UCSF Genitourinary Medical Oncology Clinic

Home to some of the country's leading specialists in cancers of the genital and urinary systems. We provide the full spectrum of care, including screening exams, transrectal ultrasound and biopsy, diagnostic imaging, second opinions and treatments ranging from surgery to radiation therapy. The clinic also offers education and support groups. In addition, patients may have access to the latest experimental therapies by participating in clinical trials.
