Rectal Cancer

The **UCSF Patient and Family Cancer Support Center** is the hub of support, information and resources for people with cancer at the **Helen Diller Family Comprehensive Cancer Center**. Learn more about UCSF’s supportive care programs at [https://cancer.ucsf.edu/support/crc/patient-support-center](https://cancer.ucsf.edu/support/crc/patient-support-center)

The **Cancer Support Center at Mission Bay** is located at 1825 4th St., 1st Floor, Room M-1210. The **Cancer Support Center at Mt. Zion** is located at 1600 Divisadero St., 1st Floor, Room B-101 (MZ. Zion location is currently not open for walk-ins)

The complete list of Patient Education Resource Pages is available to view at [http://cancer.ucsf.edu/support/crc/patient-education-resources](http://cancer.ucsf.edu/support/crc/patient-education-resources)

**Overview**

Rectal cancer occurs when cancerous cells develop in the tissue of the rectum. The rectum is the last part of the large intestine and leads to the anus, which is the opening to the outside of the body. Body waste is stored in the rectum until it is eliminated from the body through the anus. Although rectal cancer is a life-threatening disease, it is a highly curable form of cancer if found early. Therefore, regular check-ups and screenings are very important. Although the exact cause of rectal cancer is unknown, certain risk factors have been identified that may increase a person’s chance of developing the disease. These include:

- **Age.** The majority of rectal cancers are diagnosed in people aged 50 or older, although the disease affects all ages.
- **Bowel disease.** A history of colorectal cancer, intestinal polyps, and diseases such as chronic ulcerative colitis, Crohn's disease and inflammatory bowel disease increase a person's chance of developing rectal cancer.
- **Diet and exercise.** A diet high in fat, particularly from animal sources, and an inactive, sedentary lifestyle can increase a person's chance of developing rectal cancer.
- **Ethnic background and race.** Jews of Eastern European descent, called Ashkenazi Jews, have a higher rate of rectal cancer. African-Americans and Hispanics have a higher death rate caused by rectal cancer, which may be caused by insufficient screenings, poor diet and lack of exercise.
- **Family history/genetic factors.** Specific genes have been identified that significantly increase a person’s chance of having rectal cancer. People with a strong family history of colorectal cancer, as defined by cancer or polyps in a first-degree relative younger than 60 or two first-degree relatives of any age, are also at increased risk for developing rectal cancer.
• Smoking and alcohol. Research suggests that smokers and heavy drinkers have an increased chance of developing rectal cancer.

Organizations
American Cancer Society (ACS) – Rectal Cancer
At the American Cancer Society, we're on a mission to free the world from cancer. Until we do, we'll be funding and conducting research, sharing expert information, supporting patients, and spreading the word about prevention. All so you can live longer — and better.
Website: https://www.cancer.org/cancer/types/colon-rectal-cancer.html

CancerCare – Colorectal Cancer
CancerCare provides free, professional support services for people affected by colorectal cancer, as well as colorectal cancer treatment information and additional resources.
Website: https://www.cancercare.org/diagnosis/colorectal_cancer
Cancer.Net – Colorectal Cancer
This is Cancer.Net’s Guide to Colorectal Cancer. Use the menu below to choose the Introduction section to get started. Or, you can choose another section to learn more about a specific question you have. Each guide is reviewed by experts on the Cancer.Net Editorial Board, which is composed of medical, surgical, radiation, gynecologic, and pediatric oncologists, oncology nurses, physician assistants, social workers, and patient advocates.
